

Economics 102  
 Fall 2015  
 Answers to Homework #3  
 Due Monday, October 26, 2015

**Directions:**

- The homework will be collected in a box **before** the large lecture.
- Please place your name, TA name and section number on top of the homework (legibly). Make sure you write your name as it appears on your ID so that you can receive the correct grade.
- Late homework will not be accepted so make plans ahead of time. **Please show your work.** Good luck!

**Please realize that you are essentially creating “your brand” when you submit this homework. Do you want your homework to convey that you are competent, careful, professional? Or, do you want to convey the image that you are careless, sloppy, and less than professional. For the rest of your life you will be creating your brand: please think about what you are saying about yourself when you do any work for someone else!**

**You may use a calculator to do all of the calculations. Round all decimals to the nearest hundredth if necessary.**

**GDP Measurement**

1. Suppose that Republic of Economists produces three goods: books, magazines and papers. The following table provides information about the prices and output for these three goods for the years 2013, 2014 and 2015.

	Price per book	Quantity of books	Price per magazine	Quantity of magazines	Price per paper	Quantity of papers
2013	\$100	10	\$50	100	\$10	200
2014	\$100	12	\$52	108	\$10	205
2015	\$110	12	\$54	115	\$10	212

- a. Using the provided information, fill in the following table.

**Answer:**

Year	Nominal GDP
2013	$(100*10) + (50*100) + (10*200) = \$8,000$
2014	$(100*12) + (52*108) + (10*205) = \$8,866$
2015	$(110*12) + (54*115) + (10*212) = \$9,650$

- b. What is the percentage change in nominal GDP from 2013 to 2014? Provide any formulas you use and show your work in calculating this answer.

Answer:

Percentage change in a variable =  $\{[\text{New value of variable} - \text{Previous value of variable}] / (\text{Previous value of variable})\} * (100\%)$

Percentage change in nominal GDP from 2013 to 2014 =  $\{[(\text{Nominal GDP in 2014}) - (\text{Nominal GDP in 2013})] / (\text{Nominal GDP in 2013})\} * (100\%)$

Percentage change in nominal GDP from 2013 to 2014 =  $[(8866 - 8000) / 8000] * 100 = 10.83\%$

- c. What was the percentage change in nominal GDP from 2014 to 2015?

Answer:

Percentage change in nominal GDP from 2014 to 2015 =  $[(9650 - 8866) / 8866] * 100 = 8.84\%$

- d. Using 2013 as the base year, fill in the following table.

Answer:

Year	Real GDP
2013	$(100 * 10) + (50 * 100) + (10 * 200) = \$8,000$
2014	$(100 * 12) + (50 * 108) + (10 * 205) = \$8,650$
2015	$(100 * 12) + (50 * 115) + (10 * 212) = \$9,070$

- e. What was the percentage change in real GDP from 2013 to 2014?

Answer:

Percentage change in real GDP from 2013 to 2014 =  $[(8650 - 8000) / 8000] * 100 = 8.13\%$

- f. What was the percentage change in real GDP from 2014 to 2015?

Answer:

Percentage change in real GDP from 2014 to 2015 =  $[(9070 - 8650) / 8650] * 100 = 4.86\%$

g. Using 2013 as the base year, fill in the following table.

**Answer:**

Year	GDP deflator measured on a 100-point scale with 2013 as the base year
2013	$(8000/8000)*100 = 100$
2014	$(8866/8650)*100 = 102.50$
2015	$(9650/9070)*100 = 106.39$

2. The Organization for Economic Co-operation and Development (OECD) annually publishes **National Accounts of OECD Countries**. This annual publication consists of two issues, the first covering main aggregates and the second detailed tables. These publications cover: expenditure-based GDP (what we called Method 2 or the Expenditure Approach when discussing GDP measurement), output-based GDP (what we called Method 1 when discussing GDP measurement), income-based GDP (what we called Method 3 or the Income Approach when discussing GDP measurement), disposable income, saving and net lending, population, employment, and final consumption expenditure of households by purpose. The publications also include simplified accounts for the three main sectors of a country's economy: general government, corporations and households. The publications also include comparative tables based on purchasing power parities and exchange rates for different countries. Data are shown for 34 OECD countries and the Euro area. Figures provided in the country tables are expressed in the country's national currency.

Use the link below to answer the following set of questions:

[http://www.oecd-ilibrary.org/economics/national-accounts-of-oecd-countries\\_2221433x](http://www.oecd-ilibrary.org/economics/national-accounts-of-oecd-countries_2221433x)

(You have a free access to the link since UW-Madison has a subscription for its students and researchers. HOWEVER, you must be on campus when downloading the reports and this IMPLIES THAT YOU WILL NEED TO PLAN AHEAD!)

The expenditure approach tells us that

GDP = Consumption + Investment + Government Spending + Net Exports or,  
symbolically:

$$\text{GDP} = C + I + G + (X - \text{IM})$$

Let's verify whether the above identity or equation is true for South Korea's (in the tables and henceforth in this problem we will simply refer to "Korea") national accounts.

a. Fill the blanks of the table below (in billion KRW & at **current** prices):

**Answer:**

	2010 (Reference Year)	2012	2014
Consumption (including government spending)	819,821	911,938	972,952
Capital Investment	405,188	427,029	433,069
Net Exports	40,299	38,490	79,240
Statistical Discrepancy	0	0	-182
Nominal GDP	1,265,308	1,377,457	1,485,078

Table 1. on page 173 has sufficient information for answering the question above.  
(See attached page for “Gross domestic product, expenditure approach: Korea”)

b. Fill the blanks of the table below (in billion KRW & at **constant** prices with 2010 the base year or reference year):

**Answer:**

	2010 (Reference Year)	2012	2014
Consumption (including government spending)	819,821	861,259	898,014
Capital Investment	405,188	409,640	429,715
Net Exports	40,299	71,549	99,286
Statistical Discrepancy	0	-481	-475
Real GDP	1,265,308	1,341,967	1,426,540

Table 1. on page 173 has sufficient information for answering the question above.  
(See attached page for “Gross domestic product, expenditure approach: Korea”)

- c. Calculate Korea's GDP deflators for the year of 2010, 2012 and 2014 (using a 100-point scale and with 2010 the base year or reference year):

**Answer:**

	2010 (Reference Year)	2012	2014
GDP Deflator	$\frac{(\text{Nominal GDP} \div \text{Real GDP}) \times 100 = (1,265,308 \div 1,265,308) \times 100 = 100$	$\frac{(1,377,457 \div 1,341,967) \times 100 = 102.64$	$\frac{(1,485,078 \div 1,426,540) \times 100 = 104.10$

- d. Calculate the biannual growth rates (biannual is every two years) of Korea's real GDP (in percentage):

**Answer:**

	2010	2012	2014
Growth Rate of Real GDP	-	$\frac{\{(\text{Real GDP in 2012} - \text{Real GDP in 2010}) / \text{Real GDP in 2010}\} \times 100 = \{(1,341,967 - 1,265,308) / 1,265,308\} \times 100 = 6.06\%$	$\{(1,426,540 - 1,341,967) / 1,341,967\} \times 100 = 6.30\%$

### **Real GDP vs. Nominal GDP**

3. The following table includes data showing US GDP and inflation for the past ten years. The nominal and real GDP series in this table are taken from the US Bureau of Economic Analysis (<http://www.bea.gov/national/index.htm#gdp>), while the last column in the table is calculated from CPI data provided at the US Bureau of Labor Statistics (<http://data.bls.gov/cgi-bin/surveymost?bls>, CPI for All Urban Consumers (CPI-U) 1982-84=100 (Unadjusted) - CUUR0000SA0). You are encouraged to use excel or other software to do the following calculations.

Year	Nominal GDP in billions	Real GDP in billions	GDP deflator1	GDP deflator2	Inflation (%)	Inflation from CPI (%)
2005	13,093.7	14,234.2		100	-	-
2006	13,855.9	14,613.8				3.23%
2007	14,477.6	14,873.7				2.85%
2008	14,718.6	14,830.4				3.84%

2009	14,418.7	14,418.7				-0.36%
2010	14,964.4	14,783.8				1.64%
2011	15,517.9	15,020.6				3.16%
2012	16,155.3	15,354.6				2.07%
2013	16,663.2	15,583.3				1.46%
2014	17,348.1	15,961.7				1.62%

- a. According to the table above, which year is used as the base year in calculating real GDP? Explain your answer.

**Answer:**

The base year is 2009. We know this because in the base year the nominal GDP is always equal to the real GDP.

- b. Using the formula for the GDP deflator given in class, calculate the GDP deflator for the last ten years and fill out the column labeled GDP deflator1. Calculate this GDP deflator using a one-point scale.

**Answer:**

$\text{GDP deflator} = (\text{nominal GDP})/(\text{real GDP})$ . See table below for results.

- c. Now we want to redefine the base year and make 2005 the new base year. When we do this the GDP deflator in 2005 will have a value of 100 on a 100 point scale. Use your answers from part (b), GDP deflator 1, to fill out the column labeled as GDP deflator 2. Note: not only do we want you to change the base year, we also want you to change the scale from a one-point scale to a 100-point scale.

**Answer:**

GDP deflator1 in 2005 is 0.92. In order to change it to 100, we need to divide it by 0.92 and then multiply 100. Do the same manipulations to GDP deflator1 for all the other years: that is, divide each GDP deflator 1 by .92 and then multiple this figure by 100 in order to get GDP deflator 2. For example,  $\text{GDP deflator2 in 2006} = (0.95/0.92)*100 = 103.06$ . See the table below for the other results.

- d. Define inflation as the % change in the general price level; review your class notes for the general formula for the % change in the general price level. Calculate the annual inflation rate for the last ten years based upon the GDP deflator2 and fill out the column labeled inflation. Compare your calculation of the inflation rate using the GDP deflator2 to the measure of inflation provided by the CPI (see the column labeled “inflation from CPI”). Are these two measures of inflation equal? Why or why not?

Answer:

Inflation in 2006 =  $100 * (\text{GDP deflator2 in 2006} - \text{GDP deflator2 in 2005}) / (\text{GDP deflator2 in 2005}) = 3.06\%$ . Results for other years can be calculated similarly and are given in the table below.

Inflation calculated using the GDP deflator2 as the index is not equal to inflation calculated using the CPI as the index. The GDP deflator is different from the CPI in at least two aspects. (i) The calculation of the GDP deflator and the CPI involves different goods and services. For example, goods and services like exports that are produced but not consumed domestically are used in the calculation of the GDP deflator but not in that of the CPI. The goods and services like imports that are consumed but are not produced domestically are used in the calculation of the CPI but not in that of the GDP deflator. (ii) In the calculation of the CPI, the category and the quantity of the goods and services (the market basket) is fixed over time. In the calculation of the GDP deflator, however, both the category and the quantity of the goods and services may change over time depending on the level of production of these goods and services each year.

Answer:

Here's the completed table for (a), (b), (c) and (d):

Year	Nominal GDP in billions	Real GDP in billions	GDP deflator1	GDP deflator2	Inflation (%)	Inflation from CPI (%)
2005	13,093.7	14,234.2	0.92	100	-	-
2006	13,855.9	14,613.8	0.95	103.06	3.06%	3.23%
2007	14,477.6	14,873.7	0.97	105.80	2.66%	2.85%
2008	14,718.6	14,830.4	0.99	107.88	1.96%	3.84%
2009	14,418.7	14,418.7	1	108.70	0.76%	-0.36%
2010	14,964.4	14,783.8	1.01	110.02	1.22%	1.64%
2011	15,517.9	15,020.6	1.03	112.29	2.06%	3.16%
2012	16,155.3	15,354.6	1.05	114.36	1.84%	2.07%
2013	16,663.2	15,583.3	1.07	116.23	1.63%	1.46%
2014	17,348.1	15,961.7	1.09	118.14	1.64%	1.62%

## Unemployment Measurement

4. The table below provides data on US employment taken from US Bureau of Labor Statistics (in thousands).

**Answer:**

Year	Month	Labor Force	Employment	Unemployment	Unemployment Rate
2014	Jan	155486	145206	10280	6.6
2014	Feb	155688	145301	10387	6.7
2014	Mar	156180	145796	10384	6.6
2014	Apr	155420	145724	9696	6.2
2014	May	155629	145868	9761	6.3
2014	Jun	155700	146247	9453	6.1
2014	Jul	156048	146401	9648	6.2
2014	Aug	156018	146451	9568	6.1
2014	Sep	155845	146607	9237	5.9
2014	Oct	156243	147260	8983	5.7
2014	Nov	156402	147331	9071	5.8
2014	Dec	156129	147442	8688	5.6
2015	Jan	157180	148201	8979	5.7
2015	Feb	157002	148297	8705	5.5
2015	Mar	156906	148331	8575	5.5
2015	Apr	157072	148523	8549	5.4
2015	May	157469	148795	8674	5.5
2015	Jun	157037	148739	8299	5.3
2015	Jul	157106	148840	8266	5.3
2015	Aug	157065	149036	8029	5.1
2015	Sep	156715	148800	7915	5.1

- a. Fill in the missing numbers in the table. Provide any formulas you need to use in filling out the missing values as well.

**Answer:**

**Labor force = employment + unemployment**

**Unemployment rate = (unemployment/Labor force)\*100**

**Answers are given in the table above.**

- b. According to the US Census Bureau, the US has a population of about 320 million people. Why is the labor force in the above table only about 160 million people? Which groups of people are not included in the labor force? List at least four groups of people that are excluded from the labor force.

Answer:

Children, retired persons, students, homemakers, people in prison or similar institutions as well as discouraged workers who cannot find work are excluded from the labor force.

Suppose that the Republic of Economists (ROE) is a country which has exactly the same values for their labor force, their employment and their unemployment as the US in September 2015. Among those 7915 unemployed workers in the ROE, 2000 of these unemployed workers are temporarily laid-off workers and newly graduated students who expect to find a new job soon, while 1800 of these unemployed workers are searching for jobs in the market where there are few vacancies due to the type of job that is being sought.

- c. Given this information, what is the structural unemployment rate in ROE? What is the frictional unemployment rate in ROE? What is the cyclical unemployment rate in ROE? What is the natural unemployment rate in ROE? For each answer show the formula you use and the numeric values you entered in that formula when computing your answer (don't just provide a final number!).

Answer:

Structural unemployment = 1800 unemployed workers

Structural unemployment rate = (number of structurally unemployed/labor force)

\* 100 =  $(1800/156715) * 100 = 1.15\%$

Frictional unemployment = 2000 unemployed workers

Frictional unemployment rate = (number of frictionally unemployed/labor force)

\* 100 =  $(2000/156715) * 100 = 1.28\%$

Natural unemployment = Structural unemployment + Frictional unemployment = 3800 unemployed workers

Natural unemployment rate = (natural unemployment/labor force) \* 100 =

$(3800/156715) * 100 = 2.42\%$

Cyclical unemployment = Actual unemployment – natural unemployment = 7915 – 3800 = 4115 unemployed workers

Cyclical unemployment rate = (cyclical unemployment/labor force) \* 100 =

$(4115/156715) * 100 = 2.63\%$

If you read the information as 2000 that are temporarily unemployed and another 2000 that are newly graduated students:

Frictional unemployment = 4000 unemployed workers

Frictional unemployment rate = 2.55%

Natural unemployment = 5800 unemployed workers

Natural unemployment rate = 3.70%

Cyclical unemployment = 2115 unemployed workers

Cyclical unemployment rate = 1.35%

## CPI

5. Suppose that the market basket for purposes of computing the consumer price index (the CPI) in Madison contains 2 books, 10 steaks, 20 potatoes, 5 cookies, and 2 bags of charcoal. You are given the following price data for the years 2005 through 2010 in Madison.

Item	Price in 2010	Price in 2011	Price in 2012	Price in 2013	Price in 2014	Price in 2015
1 Book	\$5.00	\$5.00	\$5.00	\$6.00	\$6.00	\$7.00
1 Steak	\$4.00	\$5.00	\$4.00	\$6.00	\$5.00	\$7.00
1 Potato	\$.50	\$.60	\$.60	\$.40	\$.50	\$.80
1 Cookie	\$1.00	\$1.00	\$2.00	\$2.00	\$1.00	\$2.00
1 Bag of Charcoal	\$5.00	\$5.00	\$5.00	\$6.00	\$7.00	\$5.00

- a. Using the above data compute the cost of each market basket. Put your answers in the following table.

**Answer:**

Cost of Basket in 2010	$(2)(5) + (10)(4) + (20)(.5) + (5)(1) + (2)(5) = \$75$
Cost of Basket in 2011	$(2)(5) + (10)(5) + (20)(.6) + (5)(1) + (2)(5) = \$87$
Cost of Basket in 2012	$(2)(5) + (10)(4) + (20)(.6) + (5)(2) + (2)(5) = \$82$
Cost of Basket in 2013	$(2)(6) + (10)(6) + (20)(.4) + (5)(2) + (2)(6) = \$102$
Cost of Basket in 2014	$(2)(6) + (10)(5) + (20)(.5) + (5)(1) + (2)(7) = \$91$
Cost of Basket in 2015	$(2)(7) + (10)(7) + (20)(.8) + (5)(2) + (2)(5) = \$120$

- b. Now, calculate the CPI for 2010 through 2015 using 2010 as the base year. Enter your results in the following table. Use a 100-point scale for the CPI. Carry your answer out to two places past the decimal.

**Answer:**

Year	CPI
2010	$(75/75)*100 = 100$
2011	$(87/75)*100 = 116$
2012	$(82/75)*100 = 109.33$
2013	$(102/75)*100 = 136$
2014	$(91/75)*100 = 121.33$
2015	$(120/75)*100 = 160$

- c. Now, using the answers you got in part (b) calculate the annual rate of inflation in this economy from 2011 through 2015. Enter your answers in the table provided. Carry your answer out to two places past the decimal.

Answer:

Year	Rate of Inflation
2011	$[(116 - 100)/100]*100 = 16\%$
2012	$[(109.33 - 116)/116]*100 = -5.75\%$
2013	$[(136 - 109.33)/109.33]*100 = 24.39\%$
2014	$[(121.33 - 136)/136]*100 = -10.78\%$
2015	$[(160 - 121.33)/121.33]*100 = 31.87\%$

- d. Now, redo the CPI you found in part (b) with 2015 as the base year. Enter your results in the following table. Use a 100-point scale for the CPI. Carry your answer out to two places past the decimal.

Answer:

Year	CPI
2010	$(75/120)*100 = 62.50$
2011	$(87/120)*100 = 72.50$
2012	$(82/120)*100 = 68.33$
2013	$(102/120)*100 = 85.00$
2014	$(91/120)*100 = 75.83$
2015	$(120/120)*100 = 100$

- e. Now, using the answers you got in part (d) calculate the annual rate of inflation in this economy from 2011 through 2015. Enter your answers in the table provided. Carry your answer out to two places past the decimal.

Answer:

Year	Rate of Inflation
2011	$[(72.50 - 62.50)/62.50]*100 = 16\%$
2012	$[(68.33 - 72.50)/72.50]*100 = -5.75\%$
2013	$[(85.00 - 68.33)/68.33]*100 = 24.39\%$
2014	$[(75.83 - 85.00)/85.00]*100 = -10.78\%$
2015	$[(100 - 75.83)/75.83]*100 = 31.87\%$

- f. Compare the annual rates of inflation in part (c) and (e). Are they the same or different? Explain your answer.

Answer:

The annual rates of inflation are the same. Changing the base year does not affect the annual rate of inflation when using the CPI to calculate these annual rates of inflation (this is in contrast to the GDP deflator where the choice of base year does impact the annual rate of inflation).

# KOREA

## Table 1. Gross domestic product, expenditure approach

Billion KRW

	2007	2008	2009	2010	2011	2012	2013	2014
<b>AT CURRENT PRICES</b>								
<b>1 Final consumption expenditure</b>	<b>691 740</b>	<b>740 805</b>	<b>769 589</b>	<b>819 821</b>	<b>873 523</b>	<b>911 938</b>	<b>942 267</b>	<b>972 952</b>
